

THE IWASAWA ALGEBRA Ω_G AND ITS DUAL ARTIN COALGEBRA

ZHENG FANG AND FENG WEI

ABSTRACT. For any compact p -adic Lie group G , the Iwasawa algebra Ω_G over finite field $\mathbb{F}_p$ is a complete noetherian semilocal algebra. It is shown that Ω_G is the dual algebra of an artinian coalgebra C . We induce a duality between the derived category $\mathcal{D}_{fg}^b(\Omega_G\text{-}\mathcal{M})$ of bounded complexes of left Ω_G -modules with finitely generated cohomology modules and the derived category $\mathcal{D}_{qf}^b(C\text{-}\mathcal{M})$ of bounded complexes of left C -comodules with quasi-finite cohomology comodules.

L'algèbre d'Iwasawa Ω_G et Son Coalgèbre d'Artin Duale.

Résumé

Pour tout groupe de Lie G p -adique compact, l'algèbre d'Iwasawa Ω_G sur un corps fini $\mathbb{F}_p$ est une algèbre noethérienne, semilocale et complète. Il est montré que Ω_G est l'algèbre duale d'une coalgèbre artinienne C . On induit une dualité entre la catégorie dérivée $\mathcal{D}_{fg}^b(\Omega_G\text{-}\mathcal{M})$ des complexes bornés de Ω_G -modules à gauche avec des modules cohomologie de type fini et la catégorie dérivée $\mathcal{D}_{qf}^b(C\text{-}\mathcal{M})$ des complexes bornés de C -comodules à gauche dont leur comodules de cohomologie sont quasi-finis.

VERSION FRANÇAISE ABRÉGÉE

Dans [25], Yekutieli introduit le concept de complexe dualisant non commutatif. Avec les complexes dualisants, on peut trouver plusieurs propriétés assez remarquables sur les algèbres noethérien semilocale et complète (voir [21], [22] and [23]). Pour tout groupe de Lie G p -adique compact, l'algèbre d'Iwasawa Ω_G sur le corps fini $\mathbb{F}_p$ est semilocale noethérien complète (voir [2], [11]). Dans [21], on a utilisé le complexe dualisant pour étudier les propriétés homologiques de l'algèbre d'Iwasawa Ω_G . Il a été montré que la formule d'Auslander-Buchsbaum, le théorème de Bass et le théorème des «non trous» maintenez pour l'algèbre d'Iwasawa Ω_G . Une version duale correspondant de ces résultats a été obtenue par la théorie de dualité de Morita. De plus, il a été prouvé que l'algèbre d'Iwasawa Ω_G est auto-duale au sens de Morita. On renvoie le lecteur à [21] pour ces résultats et pour plus de détails.

D'autre part, il n'est pas difficile de montrer que le radical de Jacobson $J(\Omega_G)$ de l'algèbre d'Iwasawa Ω_G est cofini, c'est à dire, l'algèbre quotient $\Omega_G/J(\Omega_G)$ de Ω_G avec l'égard de ses Jacobson radical $J(\Omega_G)$ est de dimension finie. Heyneman et Radford ([10]) ont démontré qu'une algèbre noethérien complète dont le radical de Jacobson est cofini est l'algèbre duale d'une coalgèbre artinienne. Cela nous motive à considérer quelques propriétés de dualité entre la catégorie de Ω_G -modules et la

catégorie de C -modules. Dans cet article, on induit une dualité entre la catégorie dérivée $\mathcal{D}_{fg}^b(\Omega_G \mathcal{M})$ des complexes bornés de Ω_G -modules à gauche à cohomologie de type fini, et la catégorie dérivée $\mathcal{D}_{qf}^b({}^C \mathcal{M})$ des complexes bornés de C -comodules à gauche dont leurs comodules de cohomologie sont quasi-finis.

xxsec0

0. INTRODUCTION

In the recent years, there has been an increasing interest in the noncommutative Iwasawa algebras of compact p -adic Lie groups. The main motivation to study the Iwasawa algebras Λ_G and Ω_G of a compact p -adic Lie group G is due to their connections with number theory and arithmetic algebraic geometry (see [6], [7], [8], [12], [18], [19], [20]). Throughout, let p be a fixed prime integer, $\mathbb{Z}_p$ be the ring of p -adic integers and $\mathbb{F}_p$ be the field of p elements. Given a compact p -adic Lie group, the *Iwasawa algebra* of G over $\mathbb{Z}_p$ is the completed group algebra

$$\Lambda_G := \varprojlim \mathbb{Z}_p[G/N],$$

where the inverse limit is taken over the open normal subgroups N of G . Closely related to Λ_G is the *Iwasawa algebra* of G over $\mathbb{Z}_p$, which is defined as

$$\Omega_G := \varprojlim \mathbb{F}_p[G/N].$$

It is well-known that Λ_G and Ω_G are complete noetherian semilocal algebras and are in general noncommutative. These algebras associated with certain topological setting were defined and studied by Lazard in his seminal paper [11] at first. We would like to point out that the Iwasawa algebras Λ_G and Ω_G , despite its great interest in number theory and arithmetic, seems to have been neglected as two concrete examples for the application of noncommutative methods. Some papers are specially contributed to the ring-theoretic (or module-theoretic) and homological properties of Iwasawa algebras (see [2], [3], [4], [7], [16], [17], [19], [21]). We refer to [2] and [11] for the basic properties of Λ_G and Ω_G .

Let G be a compact p -adic analytic group and N be a closed normal subgroup of G . Passman in [13] showed us that if $R = S * G$ is a crossed product of a ring S with a finite group G , then $J(S) * G$ is contained in $J(R)$. Thus the augmentation ideal $w_{N,G} = \ker(\Omega_G \rightarrow \mathbb{F}_p[G/N]) = J(\Omega_N) * G$ is contained in $J(\Omega_G)$. On the other hand, $\Omega_G/w_{N,G} \cong \mathbb{F}_p[G/N]$ is finite dimensional. Hence $\Omega_G/J(\Omega_G)$ is also finite dimensional, being a quotient of $\Omega_G/w_{N,G}$. In this situation, we say that Ω_G has *cofinite Jacobson radical*. Heyneman and Radford [10] observed that any noetherian complete algebra A with cofinite Jacobson radical is the dual algebra of an artinian coalgebra C . Therefore we conclude that for any compact p -adic analytic group G , the Iwasawa algebra Ω_G is the dual algebra of an artinian coalgebra C (see Propostion 1.1 and Corollary 1.2).

The main purpose of this article is to describe certain duality properties between the category of Ω_G -modules and the category of C -comodules.

xxsec1

1. THE MAIN RESULTS

Let us first recall some basic definitions and existing facts. A subspace W of a vector space V over a field K is called *cofinite* in V , or simply *cofinite*, when the quotient space V/W is finite dimensional.

Let A be an algebra over a field K and M be an A -module. M is said to be *almost noetherian* if every cofinite submodule of M is finitely generated. A is called *left*

almost noetherian if it is almost noetherian as a left A -module, i.e., every cofinite left ideal of A is finitely generated. A is an *almost noetherian* algebra if A is both left and right almost noetherian. We refer the reader to the reference [10] for basic properties of almost noetherian modules and those of almost algebras.

Some topological preliminaries are necessary for our later work. Suppose that V is a vector space over a field K . We will regard the dual space V^* of all linear functionals on V as a topological vector space with the weak-* topology; that is, V^* is given the least fine topology such that the vectors of V induce continuous functionals (where we regard V as embedded in V^{**} and give the discrete topology to the scalars k). The closed (respectively, open) linear subspaces of V^* are then the annihilators $W^\perp$ of arbitrary (respectively, finite-dimensional) subspaces W of V .

Let A be an algebra over a field K . If I is a subspace of A , then

$$I^\perp = \{ f \in A^* \mid f(I) = 0 \}.$$

Recall [15, Section 6] that

$$A^0 = \{ I^\perp \mid I \text{ runs over the cofinite ideals of } A \}$$

inherits a natural coalgebra structure from the transpose of the algebra structure map $A \otimes A \rightarrow A$. Now let C be a coalgebra. If M is a finite dimensional C^* -module and $\pi : C^* \rightarrow \text{End } M$ is the corresponding algebra map, then $I_M = \text{Ker } \pi$ is a cofinite ideal of C^* . By [10, Lemma 1.2 (e)] it follows that $(\pi^*) = I_M^\perp$, the annihilator of I_M in $(C^*)^*$, so that the image (π^*) is contained in $(C^*)^0$.

A module M is said to be *rational* if the image (π^*) is contained in C (of course C is a subspace of A^0). Since we have seen in [10, Lemma 1.2 (b)] that a cofinite subspace I of A is closed when $I^\perp$, the annihilator of I in A^* , is actually contained in C , it follows that M is a rational A -module when $I_M = \text{Ker } \pi$ is closed in A .

Let C_0 be the sum of the simple subcoalgebras of a coalgebra C . We inductively define an increasing coalgebra filtration by

$$C_n = C_0 \wedge C_{n-1} = \{ x \in C \mid \Delta x \in C_0 \otimes C + C \otimes C_{n-1} \}.$$

C is said to be *finite type* when $C_1 = C_0 \wedge C_0$ is finite dimensional.

xxsec1.1

Proposition 1.1. [10, Proposition 4.3.1] *Let A be a left almost noetherian algebra with cofinite Jacobson radical. Then $C = A^0$ is a coalgebra of finite type, and the algebra map $A \rightarrow C^*$ can be identified with the map $A \rightarrow \hat{A}$ (completion with respect to the J -adic topology). In particular $C^* = \hat{A}$ is again an almost noetherian algebra with cofinite Jacobson radical.*

This proposition means that any complete noetherian algebra A with cofinite Jacobson radical is the dual algebra of an artinian coalgebra C . Moreover, the artinian coalgebra C is of finite type. We will now apply the above results to the Iwasawa algebra Ω_G , which is our work context.

xxsec1.2

Corollary 1.2. *For any compact p -adic analytic group G , the Iwasawa algebra Ω_G is the dual algebra of an artinian coalgebra C .*

Let C be the dual artinian coalgebra of the Iwasawa algebra Ω_G . ${}_{\Omega_G}M$ denotes the category of left Ω_G -modules and $\text{Rat}({}_{\Omega_G}\mathcal{M})$ denotes the subcategory of ${}_{\Omega_G}\mathcal{M}$ consisting of all rational left Ω_G -modules. It is well known that the abelian category

$\mathcal{M}^C$ of right C -comodules is equivalent to the abelian category $\text{Rat}(\Omega_G \mathcal{M})$. Furthermore, $\text{Rat}(\Omega_G \mathcal{M})$ is closed under submodules, quotients and arbitrary direct sums. In the sense of [14], it is an hereditary pretorsion class in $\Omega_G \mathcal{M}$.

For the the dual artinian coalgebra C of Ω_G , C^C is an injective object in $\mathcal{M}^C$, or equivalently, $\Omega_G C$ is an injective object in $\text{Rat}(\Omega_G \mathcal{M})$. In general, $\Omega_G C$ is not injective in $\Omega_G \mathcal{M}$. But, we have the following result (see [5, Section 9.4] and [9, Theorem 3.2]).

xxsec1.3

Proposition 1.3. *The following statements are equivalent:*

- (a) $\Omega_G C$ is injective in $\Omega_G \mathcal{M}$;
- (b) $\Omega_G C$ is an injective cogenerator of $\Omega_G \mathcal{M}$;
- (c) C_{Ω_G} is artinian;
- (d) Ω_G is right noetherian;
- (e) The injective hull of a rational left Ω_G -module is rational.

Throughout this section C is always a left and right artinian coalgebra. Let A and B be two algebras with its opposite algebras A° and B° . Let ${}_A E_B$ be an (A, B) -bimodule. We say that E induces a *Morita duality* between A and B if

- (1) ${}_A E$ and E_B are injective cogenerators in the categories of left A -modules and right B -modules, respectively;
- (2) the canonical ring homomorphisms $A \rightarrow \text{End } E_B$ and $B^\circ \rightarrow \text{End } {}_A E$ are isomorphisms.

In this case we say that A is *left Morita* and B is *right Morita*, and that A is *Morita dual to B* (or A and B are in *Morita duality*). If $A = B$, then A is Morita self-dual, or has a Morita self-duality. We refer to [1] and [24] for some basic properties of a Morita duality.

For the dual coalgebra C of the Iwasawa algebra Ω_G , let us consider the Ω_G -bimodule $\Omega_G C_{\Omega_G}$. We easily observe that $\text{End}(\Omega_G C) \cong \Omega_G^\circ$ and $\text{End}(C_{\Omega_G}) \cong \Omega_G$. Moreover, if C is both left and right artinian, then $\Omega_G C$ and C_{Ω_G} are both injective cogenerators by Proposition 1.3. It follows from [1, Theorem 24.1] that the Ω_G -bimodule $\Omega_G C_{\Omega_G}$ defines a Morita duality. Let ${}_{\Omega_G} \mathcal{R}$ (resp. $\mathcal{R}_{\Omega_G}$) be the subcategory of $\Omega_G \mathcal{M}$ (resp. $\mathcal{M}_{\Omega_G}$) consisting of $\Omega_G C_{\Omega_G}$ -reflexive modules. Thus we obtain a duality

$${}_{\Omega_G} \mathcal{R} \begin{array}{c} \xrightarrow{\text{Hom}_{\Omega_G}(-, C)} \\ \xleftarrow{\text{Hom}_{\Omega_G}(-, C)} \end{array} \mathcal{R}_{\Omega_G} . \quad (\clubsuit)$$

Let ${}_{\Omega_G} \mathcal{M}_{fg}$ be the category of all finitely generated left Ω_G -modules and ${}^C \mathcal{M}_{qf}$ be the category of all quasi-finite left C -comodules. Since the Iwasawa algebra Ω_G is noetherian and semiperfect, we get $\text{gl. dim } C = \text{gl. dim } \Omega_G$ by [9, Proposition 3.4]. Applying this fact and the duality $(\clubsuit)$ yields

xxsec1.4

Proposition 1.4. *Let C be the dual artinian coalgebra of Ω_G . Then there exists a duality between abelian categories*

$${}_{\Omega_G} \mathcal{M}_{fg} \begin{array}{c} \xrightarrow{\text{Hom}_{\Omega_G}(-, C)} \\ \xleftarrow{(\)^*} \end{array} {}^C \mathcal{M}_{qf} .$$

For any left Ω_G -module $\Omega_G M$, there is a right Ω_G -module morphism:

$$\begin{aligned} \eta_M : \text{Hom}_{\Omega_G}(M, C) &\longrightarrow M^* \\ f &\longmapsto \varepsilon \circ f. \end{aligned}$$

If M is a finitely generated Ω_G -module, then the right Ω_G -module $\text{Hom}_{\Omega_G}(M, C)$ is actually a rational Ω_G -module. Moreover, if we look on $\text{Hom}_{\Omega_G}(M, C)$ as a left C -comodule, then it is a quasi-finite comodule. Hence the image of η_M is contained in $\text{Rat}(M^*)$. Therefore we have a natural transformation:

$$\eta : \text{Hom}_{\Omega_G}(-, C) \longrightarrow \text{Rat} \circ (-)^*, \quad (\spadesuit)$$

of functors from ${}_{\Omega_G}\mathcal{M}_{fg}$ to ${}^C\mathcal{M}_{qf}$.

xxsec1.5

Lemma 1.5. *The above transformation η is a natural isomorphism.*

If ${}_{\Omega_G}M$ is a finitely generated free module, then $\eta_M : \text{Hom}_{\Omega_G}(M, C) \longrightarrow \text{Rat} \circ (M)^*$ is obviously an isomorphism. For a general finitely generated module M , M is finitely presented since Ω_G is noetherian

$$\bigoplus_{\text{finite}} \longrightarrow \bigoplus_{\text{finite}} \longrightarrow M \longrightarrow 0.$$

The statement follows from the following commutative diagram:

$$\begin{array}{ccccccc} 0 & \longrightarrow & \text{Hom}_{\Omega_G}(M, C) & \longrightarrow & \text{Hom}_{\Omega_G}\left(\bigoplus_{\text{finite}} \Omega_G, C\right) & \longrightarrow & \text{Hom}_{\Omega_G}\left(\bigoplus_{\text{finite}} \Omega_G, C\right) \\ & & \downarrow \eta_M & & \downarrow \eta & & \downarrow \eta \\ 0 & \longrightarrow & \text{Rat} \circ (M)^* & \longrightarrow & \text{Rat} \circ \left(\bigoplus_{\text{finite}} \Omega_G\right)^* & \longrightarrow & \text{Rat} \circ \left(\bigoplus_{\text{finite}} \Omega_G\right)^*. \end{array}$$

Let A be a noetherian algebra with Jacobson radical J such that $A_0 = A/J$ is finite dimensional. Let ${}_A M$ be an A -module. An element $m \in M$ is called a *torsion element* if $J^n m = 0$ for all $n \gg 0$. Let us set $\Gamma(M) = \{m \in M \mid m \text{ is a torsion element}\}$. Then $\Gamma(M)$ is a submodule of M . In fact, we obtain an additive functor

$$\Gamma : {}_A\mathcal{M} \longrightarrow {}_A\mathcal{M},$$

by sending an A -module to its maximal torsion submodule. Clearly, Γ is a left exact functor. The functor Γ has another representation $\Gamma(M) = \varinjlim \text{Hom}_A(A/J^n, M)$. We use Γ° to denote the torsion functor on the category of right A -modules.

Now let C be the dual coalgebra of Iwasawa algebra Ω_G , and let

$$\text{Rat} : {}_{\Omega_G}\mathcal{M} \longrightarrow {}_{\Omega_G}\mathcal{M}$$

be the rational functor. Since C is artinian, every finite dimensional Ω_G -module is rational by [10, Proposition 3.1.1 and Remarks 3.1.2]. Therefore, for a left Ω_G -module, it follows that $\text{Rat}(M)$ is the sum of all the finite dimensional submodules of M . It should be remarked that the Jacobson radical $J = C_0^\perp$ and C_0 is finite dimensional. Thus $\Gamma(M)$ is also the sum of all the finite dimensional submodules of M . Hence $\Gamma(M) \cong \text{Rat}(M)$. This gives that the functor Γ is naturally isomorphic to the rational functor Rat . In what follow, we identify the right derived functor $R\Gamma$ with $R\text{Rat}$.

Let C be the dual coalgebra of the Iwasawa algebra Ω_G . Then $\text{Soc}(C)$ is finite dimensional. This implies that there are only finitely many non-isomorphic simple right (or left) C -comodules. If ${}^C M$ is quasi-finite, then $\text{Soc}(M)$ is finite dimensional. Thus ${}^C M$ is finitely cogenerated. This means that ${}^C\mathcal{M}_{qf}$ is a thick subcategory of ${}^C\mathcal{M}$. So $\mathcal{D}_{qf}^+({}^C\mathcal{M})$, the derived category of bounded below complexes of left C -comodule with quasi-finite cohomology comodules, is a full triangulated subcategory of $\mathcal{D}^+({}^C\mathcal{M})$. Also, since Ω_G is noetherian, $\mathcal{D}_{fg}^-(\Omega_g\mathcal{M})$, the derived

category of bounded above complexes of left Ω_G -modules with finitely generated cohomology modules, is a full triangulated subcategory of $\mathcal{D}^-(\Omega_G\mathcal{M})$. The duality in Proposition 1.4 gives rise to a duality of derived categories.

xxsec1.6

Theorem 1.6. *Let C be the artinian coalgebra of the Iwasawa algebra Ω_G . We have dualities of triangulated categories:*

$$\mathcal{D}_{fg}^-(\Omega_G\mathcal{M}) \xrightleftharpoons[(\)^*]{R\Gamma^\circ \circ (\)^*} \mathcal{D}_{qf}^+(C\mathcal{M}), \quad \mathcal{D}_{fg}^b(\Omega_G\mathcal{M}) \xrightleftharpoons[(\)^*]{R\Gamma^\circ \circ (\)^*} \mathcal{D}_{qf}^b(C\mathcal{M})$$

By the fact that C is artinian, we know that $\mathcal{D}_{qf}^+(C\mathcal{M})$ is equivalent to the derived category $\mathcal{D}^+(C\mathcal{M}_{qf})$ of complexes of quasi-finite comodules. Since Ω_G is noetherian, $\mathcal{D}_{fg}^-(\Omega_G\mathcal{M})$ is equivalent to $\mathcal{D}^-(\Omega_G\mathcal{M}_{fg})$. In view of Proposition 1.4 we obtain the following duality

$$\mathcal{D}^-(\Omega_G\mathcal{M}_{fg}) \xrightleftharpoons[(\)^*]{\text{Hom}_{\Omega_G}(-, C)} \mathcal{D}^+(C\mathcal{M}_{qf}).$$

Applying Lemma 1.5 we easily verify that the composition

$$\mathcal{D}_{fg}^-(\Omega_G\mathcal{M}) \xrightarrow{\cong} \mathcal{D}^-(\Omega_G\mathcal{M}_{fg}) \xrightarrow{\text{Hom}_{\Omega_G}(-, C)} \mathcal{D}^+(C\mathcal{M}_{qf}) \xrightarrow{\cong} \mathcal{D}_{qf}^+(C\mathcal{M})$$

is isomorphic to the functor $R\Gamma^\circ \circ (\)^*$. Furthermore, one can observe that $R\Gamma^\circ \circ (\)^*$ sends bounded complexes to bounded complexes.

xxsec1.7

Corollary 1.7. *Let C be the dual artinian coalgebra of the Iwasawa algebra Ω_G . Then we have a duality of triangulated categories:*

$$\mathcal{D}_{fd}^b(\Omega_G\mathcal{M}) \xrightleftharpoons[(\)^*]{R\Gamma^\circ \circ (\)^*} \mathcal{D}_{fd}^b(C\mathcal{M}).$$

It is enough to show that $R\Gamma^\circ \circ (M)^* \in \mathcal{D}_{fd}^b(C\mathcal{M})$ for any finite dimensional left Ω_G -module M . Since Ω_G is noetherian and complete with respect to the J -adic filtration, the Jacobson radical J of Ω_G satisfies Artin-Rees condition. Applying [9, Theorem 3.2] yields that the injective envelop of a J -torsion module is still J -torsion. Now M^* is a J -torsion module. Thus we have an injective resolution of M^* with each component being J -torsion. Therefore $R\Gamma(M^*)$ is quasi-isomorphic to M^* , that is, $R\Gamma(M^*) \in \mathcal{D}_{fd}^b(C\mathcal{M})$.

xxsec2

2. CONSLUSION

It is well-known that there is an informal idea in the theory of derived categories of coalgebras: ‘the derived category associated to a coalgebra keeps the homological relevant information, so if two coalgebras have equivalent derived categories, they should have isomorphic cohomology’. In view of the beautiful structure and properties of the Iwasawa algebra Ω_G , C as the dual artinian coalgebra of Ω_G should have elegant properties which build stable basis for the further study of derived categories of bounded complexes of C -comodules. Let $D_{qf}^b(C\mathcal{M})$ (respectively, $D_{qf}^b(\mathcal{M}^C)$) be the derived category of bounded complexes of left (respectively, right) C -comodules with quasi-finite cohomology comodules. We wonder whether it is possible for us

to establish a duality of the derived categories of left C -comodules and of right C -comodules by the results obtained in Section 1. More precisely speaking, we have the following question:

Question 2.1. *Let C be the dual artinian coalgebra of the Iwasawa algebra Ω_G . Are there dualities of triangulated categories*

$$\mathcal{D}_{qf}^b(C \cdot \mathcal{M}) \xrightleftharpoons[G]{F} \mathcal{D}_{qf}^b(\mathcal{M}^C) \quad ?$$

Here $F = R\Gamma \circ ()^*$ and $G = R\Gamma^\circ \circ ()^*$.

Acknowledgements I have accumulated quite a debt of gratitude in writing this paper. significantly help us improve the final presentation of this
